LETTER OF TRANSMITTAL

Raleigh, N. C., March 27, 1935.

To His Excellency, J. C. B. Ehringhaus, Governor of North Carolina, Raleigh.

MY DEAR GOVERNOR EHRINGHAUS:

I have the honor of transmitting the report for the Bureau of Vital Statistics covering the calendar year, 1933.

With assurance of my very great respect, I am

Very sincerely,

Carl V. Reynolds, M.D.,

r/e

Secretary and State Health Officer.

INTRODUCTION

The annual report of the Bureau of Vital Statistics presents a tabulation of the births and deaths occurring in North Carolina as recorded with the State Board of Health. State-wide registration was begun in 1914, and the first report related to that year. Reports have been published for every year since, with the exception of 1918 and 1919.

This data is of inestimable value to the public health worker. It is useful in outlining future policies and practices and in calculating the results of past endeavors. To the individual the registration of a birth occurring in North Carolina makes it possible always to obtain an official record of the facts surrounding his advent into life. The purposes for which certified copies of birth certificates are requested indicate that their value is becoming more generally realized from year to year. Likewise, the demand for death certificates shows that this vital record is essential in upholding the right of citizens in the establishment of necessary facts in the closing event of life.

In the 1933 Annual Report of the Bureau of Vital Statistics the Abridged International List of Causes of Death has been used in tabulating deaths by counties and cities. This is the same plan that was followed for 1931 and 1932. Information for the State as a whole has been tabulated according to the detailed International List of Causes of Death. Deaths have been allocated to the place of legal residence of the deceased before death. Prior to 1932, deaths had been recorded by place of occurrence only. This gives a distorted rate for those counties that have medical centers within their borders and for the counties from which the patients are drawn. Deaths by counties and cities are tabulated by place of occurrence and by place of residence.

Although tabulation by residence corrects one, probably the greatest, source of error in comparing the rates of different localities, there are other factors that must be taken into consideration. The rates are crude rates, in the calculation of which no allowance is made for the difference in the sex, age, and color distribution of the population. For the State as a whole, 90 per cent of the deaths are believed to be reported. For any single area, the percentage may be above or below that figure, and this degree of completeness of reported deaths should be borne in mind when comparing two areas.

POPULATION

The total population of North Carolina in 1930 was 3,170,276, a gain in ten years of 611,153 or 23.9 per cent. This was the largest addition on record. There was an increase of 352,836 between 1910 and 1920,

and an increase of 312,477 for the period 1900-1910. It is not reasonable to predict as great a growth between 1930 and 1940 as occurred in the last decade.

Population is based upon three factors—births, deaths, and migration. All are important not only in themselves, but in relation to each other. The excess of births over deaths, or the natural increase, has varied at times rather widely, but for the past five years, with the exception of the present year, it shows that the source of future population is increasing. Between the census of 1920 and 1930 the State gained 611,153 persons, but the natural increase for the decade was 498,583. This means that North Carolina gained approximately 113,000 by immigration.

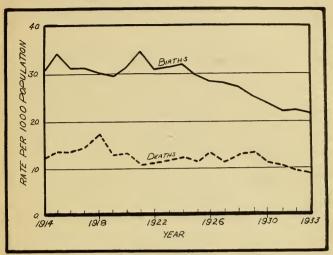

Of the total population in 1930, 809,847 or 25.5 per cent were considered urban. This included all incorporated places of 2,500 inhabitants or more. In 1920 there were fourteen cities over 10,000 population. By 1930 there were 21 in this group. The gain in these cities accounted for 71.3 per cent of the actual urban gain. In 1920 there was not a single city with a population as great as 50,000. By 1930 there were five cities—Asheville, Charlotte, Durham, Greensboro, and Winston-Salem—with a population greater than 50,000. The gain in these cities accounted for 46.6 per cent of the actual urban gain.

The mid-year population of the State in 1933, as estimated by the Bureau of the Census, was 3,275,000. The estimate for 1932 was 3,244,000. This represents an annual increase of 31,000 over 1932. Incidently, the natural increase in population in 1933 was 45,019, or a loss to the State by emigration of approximately 14,000 persons. Of the total number of North Carolina's inhabitants, 70.5 per cent (2,310,000) are white, 29.0 per cent (965,000) Negro, and 0.5 per cent "other races," the majority of which are Indians. Approximately 0.3 per cent are foreign-born.

NATALITY

Live Births: During 1933 there were 75,322 live births recorded with the Bureau of Vital Statistics, 2,558 fewer than for 1932. This is equivalent to a rate of 23.0 per 1,000 population, a decrease of 1.0 from the rate of 24.0 for 1932, and lowest ever recorded. Of the 75,322 live births, 51,490 were white, 23,265 Negro, and 567 Indian, which gave a birth rate of 22.3 per 1,000 population for white, 24.5 for Negro, and 35.4 for Indian. For the first fifteen years of State registration, the birth rate ranged between a high of 33.4 in 1915 and a low of 27.5 for 1928. There has been a gradual decline in the birth rate since 1921.

CHART 1. Birth and Death Rates per 1,000 Population for North Carolina: 1914-1932, Inclusive.

Stillbirths: In conformity with statistical practice, the stillbirths were not included in the totals of either births or deaths. Parallel to the decrease in the number of births, there were 521 fewer stillbirths than last year. The 3,122 stillbirths represents a rate of 41.4 per 1,000 live births. If they were classified as a single cause of death, the rate based on a 100,000 population would be a little more than that of tuberculosis and influenza combined. In every 100 deliveries there were approximately four stillbirths.

MORTALITY

In the compilation of mortality statistics, the cause of death as stated by the physician is used as the basis of classification by causes. Since the accuracy of statistics can be no greater than that of the material upon which it is based, it is desirable that physicians give as accurate and complete a diagnosis of cause of death as possible. A specific cause, rather than a general condition or symptom is essential if the greatest accuracy is to be expected. Hundreds of certificates are queried as to cause of death yearly in order to classify them correctly. We are duly appreciative of the prompt and courteous replies given by most

physicians when asked to give a more specific statement as to cause of death. Occasionally a certificate is queried that should not have been, but this can hardly be prevented considering that the clerks do not have the advantage of medical training and must follow more closely a rule of thumb.

Health conditions during 1933, as indicated by the death rate, were generally favorable throughout North Carolina. There were fewer deaths in the State from all causes in proportion to the total population at all ages than in any year since the beginning of State registration in 1914. The 30,496 deaths, exclusive of 3,122 stillbirths reported for 1933, represents an annual death rate of 9.3 per 1,000 population. When the number of deaths of residents of other states (367) are excluded and the residents of North Carolina (89) who died elsewhere are added, the total number of resident deaths is 30,118. The mortality rate for 1932 was 9.6; for 1931, 10.2; for 1930, 11.2; and for 1929, 12.4. (See Chart 1.) Considered in terms of total deaths, the deaths reported for 1933 were 504 fewer than for 1932, and 2,573 fewer than in 1931.

The principal causes of death in 1933 in order of their importance were heart disease, nephritis, congenital malformations and diseases of early infancy, cerebral hemorrhage, tuberculosis, the pneumonias, all accidents and cancer. These eight causes make up approximately 68 per cent of the 30,496 deaths recorded. The hazards to life and health in North Carolina have undergone a noticeable change since 1914, the first year of registration. For the most part, there has been improvement, but in some instances the change has been for the worse. The declines in death rates from specific causes have been gradual and, therefore, not very outstanding from one year to the next. But when the last twenty years are considered a great gain is evident.

CHART 2. Leading Causes of Death in North Carolina, 1914 and 1932.

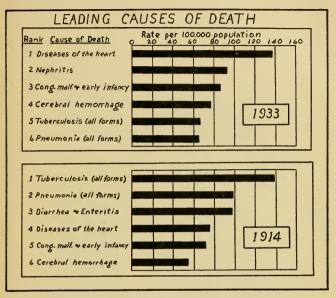

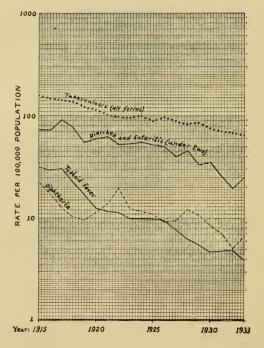

Chart 2 shows the death rates in North Carolina from the six leading causes of death in 1914, and in 1933. The relative positions of the various causes of death have changed within the last score of years. Tuberculosis is an outstanding example of the success of preventive medicine and public health in the control of infectious diseases. In 1914 this disease was the leader among all causes of death. Today it has fallen to fifth place.

Heart disease ranks first in 1933 in the list of causes of death. The death rate from this disease is more than one-third higher than it was twenty years ago. It is true that a part of this increase merely reflects the increasing proportion of older persons in the population, among whom chiefly deaths from heart disease occur; but a large part of the increase is due to a definite rise in heart disease mortality. Nephritis, not among the six leading causes of death in 1914, ranks second in 1933. What has been said regarding the increase of heart disease is equally true of nephritis.

Diarrhea and enteritis, a major cause of death in 1914, does not appear among the six leaders in 1933. The rate has fallen from 98.8 per 100,000 population in 1914 to 32.8 in 1933. Modern sanitary measures have played a large part in reducing the death rate from diarrhea among infants.

CHART 3. Death Rates per 100,000 Population for Specified Causes in North Carolina on Arithlog-grid: 1914-1933.

The decreases in the death rates from typhoid fever, diarrhea and enteritis, diphtheria and tuberculosis are shown in Chart 3. The rates are charted on semi-logarithmic grid in order to avoid error in making direct comparisons of rates between the various causes. The inclination of the lines indicate the proportionate change in each instance. It is readily discernible that typhoid fever had the greatest improvement

in mortality, diphtheria second, diarrhea and enteritis third, and tuberculosis fourth. While the trend throughout the entire period has been downward for all four causes, the mortality from tuberculosis has shown less fluctuations from year to year. Diphtheria has had two well defined rises during this period. It is further shown that the rates for diphtheria and for diarrhea and enteritis are higher for 1933 than they were for 1932.

Typhoid Fever: There was a noticeable decrease in the number of deaths from typhoid fever. The 128 deaths from this cause were thirty fewer than the 158 for 1932, with a consequent lowering of the death rate from 4.9 per 100,000 population to 3.9. Of these deaths 15 occurred in June, 28 in July, 22 in August, and 17 in September. There has been a great improvement in this condition since 1914 with its rate of 35.8 for every 100,000 population, or a total of 839 deaths, to the present rate of 3.9. For three years prior to 1933 the rate remained practically stationary, but for the present year a favorable decrease has been manifested.

Smallpox: This is the second consecutive year that no deaths were reported from smallpox. There were 35 cases reported to the Division of Epidemiology. In 1932 there were 72 cases reported with no deaths.

Diphtheria: The records concerning diphtheria do not show so favorably. There were 218 deaths with a rate of 6.7 per 100,000 population compared to 165 deaths with a rate of 5.1 for 1932. There has been a 70 per cent reduction in the mortality rate from this disease since 1915. The rate for 1933 is only slightly over half of what the rate was five years ago. Diphtheria is a disease for which we have a specific protective vaccination and is, therefore, a disease against which public health activities can be very effective. In round numbers, five-sixths of the deaths from diphtheria occur in children under five years of age. This indicates that vaccination to be most profitable must be done early in infancy.

Influenza and Pneumonia: There were 2,072 deaths from pneumonia, and 997 deaths from influenza, making a total of 3,169 recorded for 1933. The deaths from these two combined gave a rate of 96.8 per 100,000 population for 1933, as against a rate of 102.5 for 1932.

Tuberculosis: The death rate from all forms of tuberculosis was 64.4 in 1933 and 68.1 in 1932. In the past 20 years the mortality rate has declined by more than 50 per cent. Tuberculosis ranked first among the causes of death in 1914. Since then it has fallen to the record low rate for 1933, and to fifth place in the causes of death.

Of the 2,110 deaths 47.5 per cent were males and 52.5 per cent females, 42.6 per cent were white, 57.0 per cent Negroes, and 0.4 per cent Indian. The colored rate of 125.3 for tuberculosis is more than three times the white rate of 39.0.

Cancer: Cancer accounted for 1,738 deaths in 1933, giving a rate of 53.1 against a rate of 51.7 for 1932 and 48.2 for 1931. While the trend of cancer mortality has been steadily upward, it is not unreasonable to hope for at least a retarding in the increase. Early diagnosis offers a genuine opportunity for a cure. If the public can be convinced of this fact, the ascending rate will be checked.

Pellagra: The deaths from pellagra continued to decline for 1933. There were approximately one hundred fewer deaths in 1933 than the number recorded for 1932, reducing the rate from 14.6 to 11.4 per 100,000 population. The 374 deaths in 1933 were only a few more than one-third of the 1015 for 1930, the peak year for pellagra deaths.

Suicides and Homicides: The deaths from suicides decreased and those from homicides increased for 1933, the total showing 28 more than for 1932. There were 268 suicidal and 440 homicidal deaths.

Accidental Causes: Automobile accidents accounted for the greatest number of accidental deaths in 1933. There were 203 more deaths from all types of automobile accidents than for the preceding year. There were 807 in 1933 and 604 in 1932. Deaths from railroad accidents, exclusive of collision with automobiles, decreased from 134 in 1932 to 106 in 1933.

Maternal Mortality: The diseases of pregnancy, childbirth and the puerperal state continued to make the creation of new life hazardous in North Carolina. There was a decrease in the number of puerperal deaths, but the ratio to the number of live births remained about the same since parallel to the decrease in deaths there were fewer births. There were 535 maternal deaths in 1933 to 560 in 1932, giving a rate of 7.1 per 1,000 live births for the former year and 7.2 for the latter. This is in excess of the rate of approximately 6.5 for the United States Registration Area. There were 319 white, 2 Indian, and 214 Negro puerperal deaths, accounting for a death rate of 6.2 per 1,000 live births for the white and 9.3 for the Negro. The rate for the white is higher than it was for 1932, while the colored rate has fallen from 10.3. The annual rates for the past five years are 6.6 for the white, and 11.4 for the colored. Albuminuria and exlampsia accounted for more of the puerperal deaths than any other single cause. Approximately a third of the deaths were due to this cause. The second and third greatest offenders were puerperal septicemia and other accidents of childbirth,

respectively. Eighty-nine maternal deaths were chargeable to puerperal septicemia and 64 to other accidents of childbirth.

Infant Mortality: The total number of deaths under one year of age was 4,974. This is 197 fewer than for 1932, but because of the fewer number of births in 1933 the rate remained practically stationary. The rate for 1933 was 66.0 per 1,000 live births and 66.4 for 1932. Of the total deaths 2,824 were white and 2,151 colored. This gave a white rate of 54.8 and a colored rate of 90.2.

Of the total number of deaths under one year of age, 1,253 occurred under one day of age, and almost half in the first two weeks. Over fifty per cent are caused by the group known as "diseases of early infancy." Mortality from this group of causes, to which fall victims mainly infants under one month old, has changed but slightly or has actually increased. Deaths from these causes must be lowered if the present death rate of infants is to be improved. The progress made in saving young lives has been due primarily to the reduction in the number of deaths from infectious and gastrointestinal diseases. Diarrhea and enteritis as a cause of infant mortality has been reduced materially.

Every birth and death occurring in North Carolina should be recorded with the Bureau of Vital Statistics. Birth and death records have a wide variety of uses which are of great importance to individuals. Vital statistics are of practical value to every citizen of the State. For health organizations, accurate certificates are essential if our true problems are to be known, if our programs are to be intelligently planned, if we are to ascertain the effectiveness of the procedure, and if errors in our work are to be detected. Incomplete or incorrect records may lead to costly mistakes. It is, therefore, incumbent upon every citizen of North Carolina to do whatever possible to promote the completeness of our birth and death records.

TABLE I—TOTAL BIRTHS AND DEATHS (EXCLUSIVE OF STILLBIRTHS) WITH RATE PER 1000 POPULATION FOR THE YEARS 1914-1933 INCLUSIVE

Year	Birt	hs	Deat	hs
	Number	Rate	Number	Rate
1914	*71,931	31.2	29,044	12.4

"No deaths from smallpox reported during 1933.

# TABLE VIII—DEATHS (EXCLUSIVE OF STILLBIRTHS) BY CAUSE

Cause of Death	Total	Under 1 Day	1 Day
All causes	4,975	1,253	272
1. Typhoid fever	1		
6. Smallpox			
7. Measles	24		
8. Scarlet fever	4		
9. Whooping-cough	120		
10. Diphtheria	31		
11. Influenza	179		2
13. Dysentery	28		
15. Erysipelas	15		
16. Acute poliomyelitis and acute polioencephalitis	2		
18. Epidemic cerebrospinal meningitis	4		
22. Tetanus	3		
23. Tuberculosis of the respiratory system	9		
24. Tuberculosis of the meninges and central nervous system	6		
25-32. Tuberculosis (all other forms)	1		
34. Syphilis	62	5	1
35. Gonococcus infection and other venereal diseases			
36. Purulent infection, septicemia	2		
63. Rickets	11		
79. Meningitis	32		
86. Infantile convulsions	39	1	1
89. Diseases of the ear and of the mastoid process	20		
90-95. Pericarditis, endocarditis and myocarditis (acute), other diseases of			
the heart	10		
106. Bronchitis	21		
107. Bronchopneumonia	337		1
108. Lobar pneumonia.	114		
110. Pleurisy			
117. Ulcer of the stomach and duodenum			
119. Diarrhea and enteritis	575		
121. Appendicitis	1		
122. Hernia, intestinal obstruction	22		
130. Acute nephritis	8		
151. Furuncle	1		
152. Phlegmon, acute abscess	8		
153. Other diseases of the skin and of the cellular tissue	8		
157. Congenital malformation	291	68	24
158. Congenital debility	711	174	58
159. Premature birth	1,451	863	131
160. In ury at birth	191	88	25
161. Other diseases peculiar to early infancy	132	35	15
181. Accidental burns	15		
182. Accidental mechanical suffocation	61	1	2
186. Accidental traumatism by fall	8		
172. Infanticide	4	7	2
199-200. Sudden death; cause not specified or ill-defined.	88	9	10
Total all other causes	325	9	10

^{*}Including one child dying out of North Carolina but resident of the State.
